Abstract

The rapid developments of internet and communication technologies have materially altered many characteristics and concepts of the learning environment. E-learning has crucial importance in developing countries to have high potential for every government to meet a growing need for education while facing deficiency of expert teachers, shortage of update textbooks and limited teaching materials. The objective of this study is to determine the major challenges of implementing e-learning systems in far western region of Nepal. The results of this study will serve as a basic for improving higher education in developing countries. There are many commercial or free e-learning systems available on the market. Most of these e-learning systems provide lot of functionality and modules. Some courses are completely based on e-learning resources instead of traditional learning model. E-learning system also offers graphs and charts of student’s results. This system is based on linear workflow. That means students can see new learning resources and tests only after previous was done. Students can also create their own learning plan by defining dates. System is able to export this plan into general calendar format or remind students via e-mail.

Developing countries; higher education; e-learning; html; comparing; structure

Introduction

The exceptional development of Information and Communication Technology (ICT) is showing its roaring effects in every aspects of human civilization and hence, education section can’t exist in isolation. The sophistication in Internet and web technology is entirely driving teaching and learning methodology in more productive, result oriented and flexible way. It has enriched distance learning and learning into one of the essential manifestation of education especially in developing countries like Nepal where states infrastructure such as road and transportation are not accessible to the hill and the Himalayas. Even in the today’s developed countries using email and the world wide web for teaching and learning, without being restricted by time and space, e-learning program is also feasible via CD-ROMs, digital DVDs, Intranet including audio and video tapes, satellite broadcast and interactive TV(television).

The concept of e-learning was initiated during the 1980s, within the identical term of other delivery mode of online learning, while some author explicitly defines e-learning, others imply a specific definition or view of e-learning in their article. E-learning is the term for all kind of (ICT) technology-enhanced learning, where technology is use to support learning that is different from our traditional way of printed material form. It includes computing and communication facilities and features that variously support teaching, learning and a range of activities in education which constitutes hardware (CPU, monitor; projectors) and software(text editor; database and browsers). ICT is presenting a new model of education with a view of preparing students for “long life learning”. There are different ways of categorizing of e-learning, As per Algahansi (2011), there have been some classifications based on the extent of their involvement in education. Zhang et al (2006) states that e-learning provides the exploration of flexible learning methods with reduced need of travel to go to classrooms [1, 2].

World is changing towards the digital. Nepal is developing country; there are many remote areas in Nepal where the learning in school is not possible because of the problem in education material, content delivery system, student evaluation and teaching learning technology. To solve all of these problems the research is made how the concept of e-learning can be implemented and how all the students of those regions can get education by sitting at their own home [3-6].

The major objectives of this research are to develop effective tools and techniques for education, to enrich the students for better study and to provide better student evaluation system. Other objectives include assisting all the students in getting necessary learning material and outlining several critical aspects which hinder the successful implementation of e-learning system.
of e-learning in Nepal. The findings of this study have several fruitful outcomes which can be referenced by different academic institutions as well as government educational official to design a new framework of teaching and learning pedagogy in the context of Nepal.

**Literature Review**

Online Learning (OL) is considered one of the several approaches to electronic learning (e-learning). E-learning is a broader concept of learning that includes the use of all electronic means for learning. However, OL is specific to the Internet or Intranet mediated learning opportunities [3, 7]. Define e-learning as the “use of ICT, learning objects, multimedia and web technologies for learning.” E-learning may have different terms such as web-based learning, computer-based learning, virtual classrooms, and digital collaboration. The delivery of information include Internet (including intranet/extranet), audio- and video tape, satellite broadcast, interactive TV, CD-ROM etc [8]. Therefore online learning refers to the mediated learning connected with Web 2.0 integrated platforms which is accessible through the Internet. Mtebe and Raisamo (2014) investigated that instructors should develop quality course contents that meet educational benefits, suitable to learners’ knowledge, skills and capabilities to enhance Learning Management System (LMS) use, and increase learners’ happiness. Course quality has positive influence on learners’ satisfaction towards the system and having positive effect on LMS use [9-12].

Web 2.0 technology describes the integrated web platforms that allow different kinds of online interaction and sharing of information or electronic materials (e-materials). “Web 2.0 is a technology with profound potential for inducing change in the higher education sector” [13]. Applications used in the platform for the purpose of creating, sharing, communicating and collaborating make it easy for people to create confidential documents and open interactions even if they are at a far distance. Students and teachers who do not have skills of web designing or web publishing can also create and share their academic works to the world or to their own group of learning community [14]. Therefore, use of Web 2.0 technology has been getting popularity in academia. In addition, Web 2.0 integrated learning platforms foster interactivity, collaboration, creation and sharing among learners for quality learning. However, e-learning goes beyond OL because in e-learning, “the mode of course delivery can be entirely electronic (with or without an instructor) or take a more blended approach integrating electronic and classroom delivery to varying extents” [15]. OL enhanced with Web 2.0 tools is articulated as “the evolution of more user-friendly applications and interactive content encapsulated in learning objects, one need not be a coding expert to take advantage of the learning opportunities that are becoming available on the Web” [16]. McGreal and Elliott (2015) further highlighted that the developing countries also have a bright future towards accessing wealth of knowledge available in the Internet.

Higher education institutions (HEIs) in Nepal have initiated implementing online learning as e-learning to provide the traditional on-campus learning and teaching. It is believed that e-learning provides new opportunities to both the students and the HEIs by creating new and exciting opportunities [15]. Researchers in the field have explored that e-learning tools have brought significant changes in the higher education institutions by reforming their student support system and the process of educational delivery. “The development and introduction of a variety of e-Learning tools (from using email to a digital portfolio and a virtual learning environment) has been causing numerous changes in higher education institutions” [8]. Here, technological teaching refers to an integrated teaching with technologies where audio, video, graphic, simulation, animation, multimedia are considered supporting tools of teaching in both online and offline context [17].

**A. Different modes of learning in Nepali cultural traditions**

Nepal is culturally rich as “it is a multiethnic, multilingual, multi-religious and multicultural country. There are 123 different languages currently spoken in Nepal and 125 castes as well as ethnic groups are living in Nepalese society” [18]. Such a diversity demands multi-cultural education system and different modes of learning fitting to the existing cultural practices.

College of Education started adult education program through radio in 1958. It is considered to have been the first initiative towards distance education in Nepal. Another important initiative was the launching of radio education teacher training project in 2015 by the Ministry of Education (MOE) with the technical and financial support from USAID. The project started radio broadcasting since 1980 that was focused on enhancing the professional capabilities of in-service primary teachers having qualification under School Leaving Certificate (SLC) [19]. Likewise, as provisioned in National Education Commission 2015, Distance Education Centre (DEC) was established under MOE in 2016. The centre conducted teacher training and education awareness programs through radio broadcasting. After unification of DEC with National Centre for Education Development (NCED) in 2005, professional development training courses for teachers of primary to secondary level, SLC support, and radio program on education information are being conducted [20].

There are 84 centers of open school throughout the country covering all 75 districts of the nation [21]. Open schools focus on secondary level students who are out of the mainstream formal education due to various reasons. In doing so, self-learning is a major strategy through different mediums: radio/TV programs, printed materials, and e-learning contents on the Internet. Open schools and distance education programs in Nepal are also focused to job holders, residents of remote areas, household workers and people seeking of learning and earning together.

**B. Flexible learning options for Nepali students**

Flexible learning provides valuable advantages to students in competitive higher education to meet the need of diverse range of students. The central focus of flexible learning is to offer choices about when, where and how they learn [22]. While offering choices, place and mode of delivery are taken care of that empower learners in a number of ways. For example, students get autonomy to choose any suitable option for studies. In addition, students can handle work, study and social life together which enables them to adapt change with the complexities of the 21st century lifestyle. Moreover, “flexible learning is flexible in terms of start and end times, teaching modes, study materials, place, time, assessment” [23].

Nepali students having Internet can access global educational opportunities connecting Massive Open Online Courses (MOOCs), online education and e-learning offered by various universities. As of April first week 2016, country report of ALISON, one of MOOCs providers states that 29,841 learners have been educated from Nepal participating one or more courses. There are 296,031 sessions in total and 750 courses are studied from Nepal. Nepal is ranked in 31 positions out of 250 countries participating in different courses offered by ALISON [24]. This data indicates that Nepali learners are used to take the opportunities of learning options facilitate by Internet technology. This is the evidence of learning culture being developed among Nepali learners. This new culture is also known as the Internet culture of learning where students can create online community for learning [25]. Low completion rate of 6%-18% in MOOCs offered by University of London shows flexible learning in the form of MOOCs may not be suitable in Nepal because traditional culture of education is dominated by on-campus teaching and learning [26].

The flexibility in MOOCs can attract massive number of students at a single learning platform. For example, the first free online version of MOOCs attracted 2,200 students at the University of Manitoba, Canada but the number of on-campus enrolment was only 27 [27]. Likewise, Graninger (2015) reports Coursera catered its service to 5 million students offering over 400 courses from 90 partner universities around the globe by September 2016. Flexibility in learning has been the mission of the MOOCs where students get a number of benefits including choices of University and course(s) of their needs.

**C. ODL as a pedagogical tool for teacher education**

In order to understand ODL as a pedagogical tool for teacher education, this section begins with a convincing definition of Moore and Tait (2014):
“It is the fact that all or most of the teaching is conducted by someone removed in space and time from the learner, and that the mission aims to include greater dimensions of openness and flexibility, whether in terms of access, curriculum or other elements of structure.” [28]

This definition clearly separates ODL from the traditional approach of attending institutions for knowledge in rigid and structured space, time, and curriculum. However, ODL requires more guided self-learning approach because teachers and students are physically separated.

This definition clearly separates ODL from the traditional approach of attending institutions for knowledge in rigid and structured space, time, and curriculum. However, ODL requires more guided self-learning approach because teachers and students are physically separated.

Pedagogy is “the function or work of teaching; the art or science of teaching, education instructional methods” [29]. In this sense, ODL would be an ideal and practical tool for teacher education in Nepal. Historically, ODL had been used as a tool for teacher training in Nepal. ODL was used as the best tool to bridge the need of training services and geographical barrier aiming to train 5000 teachers per year [30]. Distance education is feasible to interconnect knowledge and ODL has the capacity to serve a large number of target groups at a time [31]. Through distance education, there is an access to educational opportunities that can be increased inspite of geographically challenged groups of learners; flexibility of time and speed as well and quality of education is guaranteed; teaching learning is individualized; students are free to choose their own learning environment; and learners take responsibility for the pace of learning [32].

D. ODL as a pedagogical tool for teacher education

ODL is time demanding and Internet technology has a strong support to expand the ODL programs in the form of MOOCs. For example “the University of London International Programs” initial offering of four MOOCs attracted over 210,000 initial registrations, over 90,000 active students in their first week, from over 160 countries and lead to 8,843 Statements of Accomplishment being attained” [26]. With the help of Internet facility and MOOgs a number of students from Nepal are have been participating in ODL programs offered by different universities in the world. The increasing number of students participating in ALISON MOOCs and position of Nepal in ranking shows attraction of Nepali students towards MOOCs.

Likewise, a partner institution of Indira Gandhi National Open University (IGNOU), International Centre for Academics (ICA), College of Distance Education and Online Studies has been offering various degree programs through ODL mode in Nepal since 2002 [33-35]. Out of 3527 students enrolled in 21 different programs at ICA, 1401 students have graduated to the date. The average completion rate is 37.72%. It has been handling 1200 students at present (ICA, 2016). This data shows that the ODL is highly significant. Moreover, this could also be the proof that the culture of ODL has been rapidly developing in Nepal [36].

Two of the top-ranking universities in Nepal TU and KU have started online learning following the web-based educational technology for ODL. At KU, KUSOED has recently revised the modality of the ODL program that was provided since 2011. The revision differentiates online classes from on-campus classes primarily in the ways of students-teacher communication, interaction and instructional delivery. Convenience and flexibility are the most common reasons for online classes (KUSOED, 2015). Similarly, TU has Open and Distance Education Centre (ODEC) that aims to be a lead centre for e-learning in Nepal by offering resourceful e-library, conducting virtual classes, ensuring access and equity in higher education, providing professional and non-academic courses, training education professionals in e-learning and e-management, generating research based new knowledge, developing and using economically viable open and distance LMS, and developing national and international relation with ODL providers to promote higher education [37]. Thus, both the universities have similar modality of ODL pedagogy. Classroom instruction can use valuable learning methods but e-learning can fail to exploit the most effective learning methods, which happens too often [7, 38, 39].

Implementation of ODL would be the best way to expand access to higher education in Nepal considering country’s geographical and cultural diversities. Lessons can be learnt from the practice of Open University of Sri Lanka which covers 30% of the tertiary enrolment in national universities providing education to students from diverse profile, distributed and representing all ethnic communities through its 28 learning centers across the country [40]. The University provides computer facilities, audio-visual aids, practical sessions, day school / discussion classes, tutorials/workshops/tutor clinics for student support at the centers. Other example from the South Asia is Virtual University of Pakistan (VUP) which is providing quality higher education establishing 180 outreach campuses across the 95 cities just in nine years of its establishment. VUP also uses modern technology: the Internet, television and e-learning for both instructional delivery and system management. Hizer et al. (2017) compared a traditional face-to-face instruction program to an online instruction program which used an online collaborative system enabling whiteboard activities, text and audio chats, posting of classroom lectures, sharing of files, and collaborative work on documents [8].

Research Methodology

The study which took approximately 6 months was conducted through the following phases: concept formulation, proposal writing, proposal review and approval; data collection, analysis and interpretation and presentation of findings. The questionnaire was designed to cover all the construct of the e-learning theory. Prior to administering the questionnaire validity and reliability test has been conducted as seen in to ensure it was valid and reliable. The questions was self administered by the researcher. Where the respondent did not understand the question, a clarification was made to them before they answered such questions. A sample of 150 respondents (students and administration) was selected from the sodsha devi school of Sanfe Achham of determining sample sizes.

A. Rationale of the site selection/area of study

Some secondary school of remote area of far-western region has been selected such as school of Patan, Sodha devi school of Ascham, as a site of study considering the feasibility due to limited time and resources. This site is of even more significance for the selected research topic of e-learning because the students of those schools are not aware or implemented such type of pedagogy yet.

B. Population and sampling

Though we had a target to visit and analyze data of more school but we could only take around only 150 respondent of two school considering the time and limitation. For this research, according to data collection plan, most of the data collected are primary data. Various interviews, focus group method, observation including non participatory observation, email questionnaire, website polling, various formal and informal field visits were done to collect primary information. The researcher has put its best effort to collect the reliable data as possible. Therefore the data collected and analyzed are reliable, integrated and consistent.

C. Research output

According to the questionnaires that were asked to the student, we get following output: (Table 1). This study is carried out with the help of data and information collected and based on that collected data and information, conclusion is drawn. Here, no hypothesis in conducted prior to the research work and then tested. In other words this research is conducted from specific to general. With the help of many instances, the conclusion of research is induced.

Questionnaire Survey Data Analysis

As part the research plan, two sets of questionnaire were prepared, one for the students and other for the school management of Sodsha...
The perception of student's performance on online versus class room courses

According to the survey responses, most of the school authorities believe that the launching of online courses have good impact on their students as illustrated by overwhelmingly 35% of positive responses. Still 25% of the school management felt that their student prefers learning better on class room courses. Out of 150 responded 15% felt that their students learn equally well on online and class room courses and 25% of school management can’t tell the answer of which method of learning is better for their student (Figure 1, Table 2).

Proportion of e-learning material used by teacher

As per the primary data collected from 150 population sample, the school management responded that 50% of their teacher minimally used e-learning materials in class room to deliver their lessons, 27% moderately used while 23% used some form of e-learning materials and contents in their class room. It shows that very less proportion of have their technical skills and compatibility towards e-learning concept (Figure 2, Table 3).

The level of student’s software and computer experiences

When asked to 150 population sample regarding their student's software and computer experience, nearly 22% replied that their student knew both word and spreadsheet package.

Interestingly, the school management responded that their student have nearly equal experiences on both practical software and webpage development and computer programming and networking. Finally less than 2% were very good in intensive application and system programming on account of their student (Figure 3, Table 4).

Total amount of time student use the internet for educational purposes

A survey was conducted to find out the amount of time student spend their time using internet for educational purpose. The result shows that 68 respondents accounting for 42% spoke that their student uses the internet 3-4 times in a week. 37 and 38 respondent accounting for 23% and 24% said that their student use internet 5-7 times in a week and 1-2 times in a week. Finally, 17 respondents said their student use internet more than 7 times in a week (Figure 4, Table 5).

The amount of time spent for internet uses for educational purpose among the teachers

The survey concludes the fact that about 44% corresponding to 70 respondent said that they spent less than 60 minutes for internet for educational purpose. Nearly 23% correspond to 30 respondent replied that they use internet for up to 120 minutes. 30 respondent accounting for 19% said that they use 120 minutes or more for educational purpose and finally 14% accounting for 22 participants said they use 60-90 minutes for educational purpose in the internet.

The amount of e-learning materials student have been exposed to in their programme

As per the survey result, the following facts were revealed:

- 23% of the respondent around 17% say that there is not any e-learning materials used in their academic program during their study.
- 25% think that we lack the proper technical infrastructure, tools and technologies to implement the e-learning concept in Neplease School.
- 19% of the respondent revealed the fact that insufficient technical skills among the teachers are a major hurdle of e-learning success.
- A high majority of respondent around 28%, i.e. 45 have pinpointed high implementation cost as a major region behind the problem.

The major issues that hurdle in successful implementation of e-learning concept in school

Survey was conducted in order to find the major caused hurdling the implementation of the e-learning pedagogy in school. It generates the following outcome:

- As per the conclusion, the major portion of the respondent, 25% think that we lack the proper technical infrastructure, tools and technologies to implement the e-learning concept in Neplease School.
- Around 19% of the respondent revealed the fact that insufficient technical skills among the teachers are a major hurdle of e-learning success.
- A high majority of respondent around 28%, i.e. 45 have pinpointed high implementation cost as a major region behind the problem.
16% said that there is a lack of proper vision on e-learning concept among different stake holders of education sectors. Very less responded nearly 12% claim that load shedding and electricity has been a major challenge for successful implementation of e-learning in Nepalese schools.

**B. Questionnaire for students**

This part of questionnaire is prepare for the students of different schools of Achham district who are directly or indirectly involved in e-learning pedagogy. The researcher aims to find the level of understanding towards e-learning concept among students and also attempts to highlight their interest towards e-learning area.

**What is the amount of e-learning material students have been exposed to in their programming?**

**Table 10: An internet access of student at home**

**The level of computer skill among the students**

A survey was conducted among the student to explore their computer skills from the beginner to the experts. The following result was observed: (Figure 8, Table 9).

As per result out of 150 respondents, 35% (52) said that they were competent in their computer skills. 29% (42) said they were proficient in computer skills and 24% (35) said that they were beginners. Only 12% (18) said they were expert in computer skills.

**An internet access of student at home**

As research proceeds, researcher attempts in inquire if the students have internet access at home as internet is regarded one major aspect of e-learning implementation (Figure 9, Table 10).

According to the survey poll majority of the respondents, 65 students (43%) have no internet in their home. 30% students said that they have internet in their home, and 27% (40) students said that they will access internet in near future.

**The total times student use internet for educational purpose**

The researcher has conducted a survey in order to find out the total amount of time that student use internet for educational purpose (Figure 10, Table 11).
According to the survey poll, 30 respondents (20%) use the Internet less than 20 minutes for educational purposes, 47 respondents (31%) use the Internet 20-40 minutes, 42 respondents (28%) use the Internet up to 120 minutes, and 31 respondents (21%) use the Internet 120 minutes or more for educational purposes.

The preferences level of students on blended courses over face-to-face courses

According to the survey conducted, following results were observed: (Figure 11, Table 12). According to the survey poll, 50 respondents (33%) agreed that blended courses are better than classroom courses, 25 respondents (17%) strongly agreed on blended courses, 47 respondents (31%) agreed on blended courses, 38 respondents (25%) are neutral, and 25 respondents (17%) are disagree with blended courses than classroom course. Finally, 12 respondents (8%) are strongly disagree with blended courses, they think that class room course is better than blended course.

The level of preferences of student towards offline rather than online courses

According to the survey, the following results were obtained: (Figure 12, Table 13). A significant number of respondents 65 (43%) disagreed with offline courses, they prefer online course is better than offline courses, only 45 (30%) student agreed on offline course and 25 (17%) are strongly agree on offline courses, they think that offline courses is better than online courses and finally, only 15 (10%) students are strongly disagreed on offline courses, they prefer online course than that of offline course.
The level of preferences of student over e-learning pedagogy in future

According to the survey conducted, the following results were obtained: (Figure 13, Table 14)

A large number of students specifically 60 respondents are agree on online courses in future, 20 respondent(13%) are strongly agree on online courses and they want e-learning pedagogy in future, 45 respondent (30%) are disagreed on online course in future and finally, 25 respondent(17%) are strongly disagreed on online course in future.

The medium of study students find most helpful to their leaning

During research, a survey was conducted in order to explore the best study medium used in learning that helps the students to learn in best and effective way. The survey concluded the following result: (Figure 14, Table 15).

According to the survey poll, 55 respondent(37%) prefer practical classes are more helpful in their learning, on 15 students (10%) thinks that lecture medium is more helpful in learning, and 38 student prefer e-learning method of study is more better in learning, and finally more 42 students(28%) thinks that blended learning method of study will more helpful in their learning than other types of learning methods.

Some prime factors being liked by student in e-learning course

A survey has been conducted to find out some factors being liked by student in e-learning course, the result is as follows: (Figure 15, Table 16).

According to the survey , 50 students(34%) like pictures and animations, 35 students(23%) like multimedia enhanced content, 44 students(29%) like explanation in e-learning and only 21 students(14%) do not like any one of these content.

The reasons of preferring e-learning methodology over the traditional one

A survey was conducted to find out the reasons of preferring e-learning methodology over traditional one, and the result obtained is as follows: (Figure 16, Table 17).

According to the survey, student prefer e-learning over traditional methodology, because 28%(42) believe in cognitive based learning.

Analysis and Design Blended Model

Nepal is a land locked country which is situated in geographically hilly region where transportation infrastructure is very expensive. In the Himalaya and mountain region it is very difficult to go school; it takes 2-3 hours to go to school. Generally speaking around 89% of population of Nepal lives in villages as one of the poorest economics in Asia, there is a large difference in the standard of living between the urban areas and the rest of the country. Undoubtedly there is a major contributor to the fact that only 2% of the total population receives higher education.
In this study, the researcher has analyzed the present teaching-learning pedagogy that exists in Nepalese education system. It has been observed that Nepal government and other private institution have been investing a huge amount of money in education sector but the outcome doesn’t seem to be satisfactory in terms of quality, productivity and academic standards. The main reason behind these unsatisfactory academic outcomes has been found due to the traditional and teacher centric teaching pedagogy which restrict the students to explore them in a productive way.

A. Situation analysis of education in secondary schools of Nepal

The world is not as static as it used to be ten years ago. Things and concept are coming up and going down at rapid rate. The syllabus that was made ten years ago is now almost outdated. Therefore, our course needs to embrace the change environment and the better ways of learning methodology develop every day.

Class learning will focus on learning concept that will not change in near future and e-learning on concept that is dynamic in nature say for example computer and mobile technology.

During the research, it has been observed that “Chalk and Talk” based traditional and teacher centric methodologies are still dominating the Nepalese education which is still highly recommended by most of the stakeholders of Nepalese schools. In this teaching approach, learning objectives are often undermined and the teachers way of understanding the learning material is presented the way the teacher has understood. Often the key concept that the teacher has felt important and his derivation and understanding are more highlighted. The traditional and even present rigid education system in Nepal still believes that a teacher after attaining certain academic levels has understood how student should be prepared for their future by reading the objectives of the lessons found in the prologue of each chapter in a textbook.

B. Blended learning, a positive jumpstart in Nepalese education

To overcome the aforesaid problems in learning system of Nepalese context, researcher proposes ICT based learning approach which offers powerful and effective tool to deliver the education to the students.

It is the model that combines the traditional approach of pedagogy with the modern learning. Basically, manifests the classroom as well as anywhere learning scheme. Certain credits of learning are acquainted by the help of teachers face to face physically present in a room. The learning materials such as blackboard/whiteboard, chalk and listening and note making are done on the spot. Teachers do ask questions and take exams and verify the objectives of learning in the classroom. Group of the students can interact with each other and know that they all have come to learn in the classroom for their better future. Such traditional pedagogical methodology is combined with e-learning where there is no teacher and only the student desire to learn aids himself/herself for understanding the concept. Besides, the multimedia rich contents also help the pupils to grasp the concept clearly. Student can learn anytime, anywhere and any place. Even the old lectures can be retrieved and assignment submitted to the teachers online. This saves time, money and other resources.

Due to traditional learning methods still popular, total e-learning cannot be put directly though there are some distance learning university/college that admit student online. However, such ambitious scheme of total e-learning will not be productive in context to Nepal because the use of ICT in education is still in infant stage. Hence, blended model of learning can be positive jumpstart in Nepalese context.

The result of conducted research over different school of Achham has also shown very positive responses of students and school administration towards ICT based blended learning. Such solution to better learning for new generation children will definitely be productive and will prepare them for the new generation to face the new challenges.

C. Cost Benefit Analysis

To overcome the aforesaid problems in learning system of Nepalese context, researcher proposes ICT based learning approach which offers powerful and effective tool to deliver the education to the students.

Initial cost is high

Developing any new system without cost is like a dream. Therefore, e-learning portal development and its implementation in hardware and software cost a lot in addition to repair and maintenance in the country like Nepal where fundamental necessity factors such as power and energy is punctuated. Besides, there need to be high skill manpower to develop and train e-learning courses.

Lower delivery cost

Putting aside the initial cost of installation and setup, blended learning system will definitely have advantage and cut cost nearly

Figure 17: Wimax coverage area of NTC all over Nepal
E-learning is the need of the present and future especially in developing countries like Nepal. It is efficient, time saving and cost effective in the long run. Implementing e-learning in the blended model is the necessary measures in places where transportation is poor. While exploring the secondary schools of remote area of far western region, it was found that few schools had computer class starting from grade five mainly in theory class. The computers were mainly donated and very few. The computers were not smoothly used due to different technical barriers. Majority of schools had no computer science subject and were quite oblivious to computer and the technology. It is also concluded from the research that the most limiting factor in implementing e-learning includes cost of infrastructure setup, connection, training people etc besides load shedding and internet availability and bandwidth problem.

In response to the second objective of analyzing the responses of the student and the secondary schools on various mode of learning, it was found that education manifested with ICT was the most popular mode of e-learning to the students. During the research, the school of Achham such as Sodsha devi higher secondary school have used interactive white board or have introduced DVD based offline training or have started computer science subject with practical.

The researcher has observed it as a small step towards the path of blended e-learning approach. The researcher also is firmly of the opinion of first honing the IT skills in the educational pedagogy so that the ICT becomes a boon when it is understood and is leverage in narrowing the digital divide that is growing too fast inside and outside the country. The government is also aware of the revolution of e-learning in Nepal but it is unable to play any substantial role in leveraging the use of ICT in education all over the country. However, Ministry of Education (MOE) along with the open learning Exchange Nepal (OLEN) - A nonprofit US organization based in Kathmandu have so far distributed more than two thousand children in 26 school across 6 district affordable educational tools called XO laptops with internet access in its first pilot phase in the year 2008. On the other hand, it is high time that the government should stop banking on international Non government organization (INGO) for the distribution of educational tools such as laptop.

Finally, a proposed e-learning model is presented that will be hosted in the Nepal using ADSL Internet/intranet infrastructure laid by NTC.

### B. Recommendation

The following recommendation is made in the interest of adopting e-learning in the secondary schools of rural areas of far western region as well as throughout the nation.

1. Nepal government should take necessary steps to develop proper ICT infrastructure required for e-learning.
2. Nepal government should formulate new policies and amend the policies that are curbing the growth of ICT.
3. There should be provision of free access of internet and computer in rural areas so that they can benefit from e-learning thus bridging the digital divide in rural and urban areas. Hotspots and other wireless facilities to access internet should be implemented by the government.
